Welcome to Luigi's Pizza!

Luigi has hired you to improve some code he uses at his pizza place.
The code we need to work on is shown below.

Read through the code line-by-line with your partner before writing down your observations in the tables below.

```
; cost : String -> Number
; given a Topping, produce the cost of a pizza with that
topping
(define (cost topping)
  (cond
    [(string=? topping "cheese")     9.00]
    [(string=? topping "pepperoni") 10.50]
    [(string=? topping "chicken")   11.25]
    [(string=? topping "broccoli")  10.25]
    [else "Sorry, that's not on the menu!"]))
```

I notice…	I wonder...

Familiar things I see in the code	Unfamiliar things I see in the code
